Prednisolone is a steroid medicine, prescribed for many different conditions, including serious illness. 

1. WHAT PREDNISOLONE IS AND WHAT IT IS USED FOR 

Prednisolone belongs to a group of medicines called corticosteroids. Their full name is corticosteroids. Corticosteroids occur naturally in the body. Their main role is to reduce inflammation. 

In your body, each corticosteroid (such as Prednisolone) works in a similar way to natural corticosteroids, reducing the inflammation resulting in the body. Prednisolone reduces the inflammation response of the body, which is giving in making the symptoms less likely to happen. The corticosteroids appear to help to maintain the hormone levels of the body normally.
If you have any further questions on the use of this product, contact your doctor before taking this medicinal product.

Withdrawal of treatment in the following patients should be gradual;

- If you have been taking more than 40 mg Prednisolone can not produce enough steroids
- If you have been taking Prednisolone because your body has recently prescribed you with a short course
- If you have been on steroid treatment.

It is important that you stay under the close supervision of your doctor or pharmacist.
