Clarithromycin Actavis 250 mg and 500 mg Film-coated Tablets
Clarithromycin

Read all of this leaflet carefully before you start taking this medicine because it contains important information for you.

• Keep this leaflet. You may need to read it again.
• If you have further questions, ask your doctor or your pharmacist.
• This medicine has been prescribed for you only. Do not pass it on to others. It may harm them, even if their signs of illness are the same as yours.
• If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet:
1 What Clarithromycin Actavis is and what it is used for
2 What you need to know before you take Clarithromycin Actavis
3 How to take Clarithromycin Actavis
4 Possible side effects
5 How to store Clarithromycin Actavis
6 Contents of the pack and further information

1 What Clarithromycin Actavis is and what it is used for
Clarithromycin is an antibiotic belonging to a group called the macrolides. Antibiotics stop the growth of bacteria which cause infections.
Clarithromycin Actavis is used to treat infections such as:
• Chest infections such as bronchitis and pneumonia
• Throat and sinus infections
• Skin and tissue infections
• Mycobacterial infections
• *Helicobacter pylori* infection associated with duodenal ulcer.

2 What you need to know before you take Clarithromycin Actavis
Do not take Clarithromycin Actavis if you:
• are allergic to clarithromycin or other macrolide antibiotics, such as erythromycin or azithromycin, or any of the other ingredients of this medicine (listed in section 6).
• have liver or kidney problems. If you develop symptoms of hepatic disease such as anorexia, yellowing of the skin (jaundice), dark urine, pruritus or tender abdomen, please stop taking Clarithromycin Actavis and inform your doctor immediately (see section 4 ‘Possible side effects’).
• you or someone in your family has a history of heart rhythm disorders (ventricular cardiac arrhythmia, including torsades de pointes) or abnormality of electrocardiogram (ECG, electrical recording of the heart) called ‘long QT syndrome’.
• have low level of potassium in your blood, a condition called hypokalaemia.
• are taking ergotamine or dihydroergotamine tablets (for migraines), or using ergotamine inhalers. Consult your doctor for advice on alternative medicines.
• are taking cimetidine (for stomach disorders), cisapride (for stomach disorders), pimozide (for some mental illnesses), terfenadine or astemizole (for hay fever or allergy), as combining these drugs with clarithromycin can sometimes cause serious disturbances in heart rhythm. Consult your doctor for advice on alternative medicines.
• are taking lovastatin or simvastatin (for high cholesterol) as combining these drugs with clarithromycin can sometimes cause a muscular condition called rhabdomyolysis.
• are taking ticagrelol (a blood thinning medicine) or ranolazine (to treat angina).
• are taking colchicine (for gout).

**Warnings and precautions:**
Talk to your doctor or pharmacist before taking Clarithromycin Actavis if you:
• have myasthenia gravis (a disorder which causes muscle weakness).
• are pregnant, may be pregnant or are breast-feeding.
• if you develop severe or prolonged diarrhoea during or after taking clarithromycin, tell your doctor immediately, as this could be a symptom of more serious conditions such as pseudomembranous colitis or clostridium difficile associated diarrhoea.

**Other medicines and Clarithromycin Actavis:**
Tell your doctor or pharmacist if you are taking, have recently taken or might take any other medicines. This is especially important if you are taking the following medicines:
• digoxin, quinidine or disopyramide (for heart problems). Your heart may need to be monitored (ECG test) or you may need to have blood tests if you take clarithromycin with some medicines used to treat heart problems.
• warfarin (for thinning the blood). It may be necessary to have blood tests to check that your blood is clotting efficiently.
• ergotamine or dihydroergotamine (for migraines).
• carbamazepine, valproate, phenobarbital or phenytoin (for epilepsy).
• simvastatin or lovastatin (for high cholesterol).
• colchicine (for gout). Your doctor may wish to monitor you.
• omeprazole (used for the treatment of indigestion and gastric ulcers) unless your doctor has prescribed it for you to treat *Helicobacter pylori* infection associated with duodenal ulcer.
• theophylline (used in patients with breathing difficulties such as asthma).
• terfenadine or astemizole (for hayfever or allergy).
• triazolam, alprazolam or midazolam (sedatives).
• cilostazol (for poor circulation).
• cisapride (for stomach disorders).
• methylprednisolone (a corticosteroid).
• vinblastine (for treatment of cancer).
• ciclosporin (immune suppressant).
• pimozide (for mental problems).
• rifabutin, efavirenz, nevirapine, rifampicin, rifapentine, fluconazole, atazanavir, itraconazole and saquinavir (treatments for infectious diseases).
• tolterodine (for overactive bladder).
• tacrolimus (for organ transplants and severe eczema).
• ritonavir, etravirine (an anti-viral or anti-HIV drug).
• sildenafil, vardenafil and tadalafil (for impotence in adult males or for treating high blood pressure in the blood vessels of the lung).
• zidovudine (to treat viruses).
• insulin, rosiglitazone, repaglinide, pioglitazone or nateglinide (medicines for the treatment of diabetes).
• aminoglycosides (a type of antibiotic) such as gentamycin, streptomycin, tobramycin, amikacin or netilmicin.
• a herbal remedy called St John’s Wort, used to treat depression.
• calcium channel blockers metabolized by CYP3A4 (e.g., verapamil, amlodipine, diltiazem) due to the risk of hypotension.

**Pregnancy and Breast-feeding**
If you are pregnant or breast-feeding, think you may be pregnant or are planning to have a baby, ask your doctor or pharmacist for advice before taking this medicine as its safety in pregnancy and breast-feeding is not known.

**Driving and using machines**
There should be no effect on the ability to drive and operate machinery. You should closely observe your response to Clarithromycin Actavis and avoid driving if you think that this medicine is affecting your balance and your orientation.

**Clarithromycin Actavis contains glucose**
If you have been told by your doctor that you have an intolerance to some sugars, contact your doctor before taking this medicinal product.

**3 How to take Clarithromycin Actavis**
Always take this medicine exactly as your doctor has told you. Check with your doctor or pharmacist if you are not sure.

**Adults and children over 12 years**
The recommended dose is one 250 mg tablet in the morning and one in the evening. In severe infections, your doctor may increase the dose to 500 mg twice daily. The usual length of treatment is between 6 and 14 days.

**Patients with kidney problems**
If you have kidney problems or certain infections, your doctor may give you a different dose.

**Children younger than 12 years**
These tablets are not suitable for children under 12 years. Your doctor will prescribe another suitable medicine for your child.

**For infections caused by certain types of bacteria called mycobacteria:**
The recommended dose is 500 mg twice daily. Your doctor may increase the dose to 1000 mg twice daily if no response is seen after 3-4 weeks. For the prevention of mycobacterial infections, the usual dose is 500 mg twice daily.

**For the treatment of Helicobacter pylori infection associated with duodenal ulcers:**
There are a number of effective treatment combinations available in which Clarithromycin Actavis is taken together with one or two other drugs. These include the following:
• Triple Therapy (7 days)
  Clarithromycin Actavis 500 mg twice daily together with amoxicillin 1000 mg twice daily and a proton pump inhibitor at the recommended daily dose for 7 days.
• Triple Therapy (7 days)
  Clarithromycin Actavis 500 mg twice daily together with a proton pump inhibitor at the recommended daily dose and metronidazole 400 mg twice daily for 7 days.
• Triple Therapy (7-10 days)
  Clarithromycin Actavis 500 mg twice daily together with amoxicillin 1000 mg twice daily and omeprazole 20 mg once daily for 7-10 days.
• Dual Therapy (14 days)
Clarithromycin Actavis 500 mg three times daily for 14 days together with omeprazole 40 mg once daily.
If you are unsure which tablets you should be taking, or for how long you should be taking them, please consult your doctor for advice.

If you take more Clarithromycin Actavis Tablets than you should
If you (or someone else) swallow a lot of tablets at the same time, or you think a child may have swallowed any, contact your nearest hospital casualty department or tell your doctor immediately.

If you forget to take Clarithromycin Actavis
If you forget to take a dose take another as soon as you remember, unless it is nearly time for the next dose. Do not take two doses at the same time to make up for forgotten individual doses.

If you stop taking Clarithromycin Actavis
Do not stop taking Clarithromycin Actavis because you feel better. It is important to take the tablets for as long as the doctor has told you to, otherwise the problem might come back.

4 Possible side effects
Like all medicines, this medicine can cause side effects, although not everybody gets them.

Contact your doctor immediately if the following side effects occur:
• Allergic reactions including rashes have been reported with clarithromycin. Allergic rashes may range in severity from mild itchy skin eruptions to rarer more serious skin eruptions (such as Stevens-Johnson syndrome). In very rare cases, difficulty in breathing, fainting and swelling of the face and throat can occur which may need emergency treatment.
• Rarely jaundice and other liver or gall-bladder disorders. You may feel generally unwell or develop yellow skin and/ or eyes, or pale stools with dark urine.
• Severe or prolonged diarrhoea, which may have blood or mucus in it, during or after taking Clarithromycin Actavis. Diarrhoea may occur over two months after treatment with clarithromycin.

Common side effects (between 1 and 10 in every 100 people are likely to get these):
• stomach problems such as feeling or being sick, stomach pain, indigestion or diarrhoea.
• changes in liver enzymes (as seen in blood tests).
• increased sweating, flushing.
• headache, change in the way things taste or smell.
• difficulty sleeping.
• changes in sense of taste.
• headache.

Uncommon side effects (between 1 and 10 in every 1,000 people are likely to get these):
• ‘thrush’ in the mouth and in the genital area.
• high concentration of eosinophils (a type of white blood cells).
• low concentration of leucocytes and neutrophils (types of white blood cells).
• loss of appetite (anorexia).
• feeling of restlessness and agitation (anxiety).
• fainting, dizziness, drowsiness, tremors, involuntary movement of the tongue, face, lips or limbs.
• ‘ringing’ in the ears, hearing loss or balance problems (vertigo).
• irregular heart beat (arrhythmias) and palpitations.
• digestive problems such as constipation, belching, heartburn, abdominal distension, wind or anal pain.
• sore or dry mouth, swollen tongue.
• inflammation of the lining of the stomach or oesophagus (the tube connecting your mouth with your stomach).
• increased amounts of certain substances in the blood (transaminases, alkaline phosphatase and lactate dehydrogenase).
• liver disorders (hepatitis and cholestasis).
• itching (pruritus), hives (urticaria) and inflammation of the skin.
• feeling unwell (asthenia), feeling tired, pain in the chest and feeling cold (chills).
• stiffness, aches or spasms in the muscles.
• kidney problems such as raised levels of protein normally excreted by the kidneys or raised levels of kidney enzymes.

**Frequency not known** (cannot be estimated from the available data):
• severe inflammation of the bowel (pseudomembranous colitis) linked to antibiotic use.
• severe skin infections (erysipelas and erythrasma).
• a dangerous drop in a type of white blood cells. (agranulocytosis); a drop in the number of platelets (thrombocytopenia).
• hallucinations (seeing things), abnormal dreams, confusion, feelings of unreality, loss of bearings (disorientation).
• convulsions.
• loss of ability to taste and smell things.
• loss of hearing.
• accelerated (tachycardia) or irregular heart beat (Torsades de Pointes).
• haemorrhage.
• inflammation of the pancreas (acute pancreatitis).
• teeth and tongue becoming discoloured.
• hepatic failure and jaundice (yellowing of the skin).
• various skin eruptions or rashes like the Stevens-Johnson syndrome, toxic epidermal necrolysis or a condition called drug rash with eosinophilia and systemic symptoms (DRESS).
• muscular problems like rhabdomyolysis, myopathy and myasthenia gravis (a condition in which the muscles become weak and tire easily).
• kidney problems (nephritis) and kidney failure.
• abnormal colour of the urine and abnormal levels of a clotting factor (prothrombin).
• swollen face, lips, throat or tongue.
• numbness, tingling or pins and needles.
• manic reactions

Clarithromycin may worsen the symptoms of myasthenia gravis (a condition in which the muscles become weak and tire easily) in patients who already suffer from this condition.

**Reporting of side effects**
If you get any side effects, talk to your doctor, pharmacist or nurse. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via
5 How to store Clarithromycin Actavis

Keep this medicine out of the sight and reach of children. Do not store above 25°C.

Do not use Clarithromycin Actavis after the expiry date which is stated on the carton and blister foil after the abbreviation ‘Exp’. The expiry date refers to the last day of that month.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throw away medicines you no longer use. These measures will help to protect the environment.

6 Contents of the pack and other information

What Clarithromycin Actavis contains

The active ingredient (the ingredient that makes the medicine work) is clarithromycin. Each tablet either contains 250 mg or 500 mg of the active ingredient.

The other ingredients are: microcrystalline cellulose (E460), colloidal anhydrous silica, croscarmellose sodium, povidone, stearic acid, talc, magnesium stearate (E470), hypromellose (E464), propylene glycol, vanilla dry flavour (contains artificial vanilla flavouring, glucose, palm oils and coconut oils), titanium dioxide (E171), quinoline yellow (E104), hyprolose (E463) and sorbic acid (E200-E201).

What Clarithromycin Actavis looks like and contents of the pack

Film-coated tablets.
250 mg tablets: Yellow, oval-shaped, convex film-coated tablets scored on one side.
500 mg tablets: Yellow, oval-shaped, film-coated tablets.
Clarithromycin Actavis 250 mg and 500 mg film-coated tablets are packed in blisters with 14 tablets.
