Summary of Product Characteristics

1 NAME OF THE VETERINARY MEDICINAL PRODUCT
Tiamulin 80%
Premix for medicated feed for pigs, chickens and turkeys.

2 QUALITATIVE AND QUANTITATIVE COMPOSITION
Active substance:
Tiamulin hydrogen fumarate - 800 mg/g
Excipients: For full list of excipients, see section 6.1

3 PHARMACEUTICAL FORM
Premix for medicated feeding stuff.

4 CLINICAL PARTICULARS

4.1 Target Species
Pigs.
Chickens (broiler, replacement pullet, layer/breeder).
Turkeys (poul' (grower) and breeder).

4.2 Indications for use, specifying the target species

Pigs
For the treatment and prevention of swine dysentery caused by Brachyspira hyodysenteriae.
For the treatment of colitis caused by Brachyspira pilosicoli.
For the treatment of ileitis caused by Lawsonia intracellularis.
For the treatment of enzootic pneumonia caused by Mycoplasma hyopneumoniae.

Chickens
For the treatment and prevention of chronic respiratory disease (CRD) and airsacculitis caused by Mycoplasma gallisepticum and Mycoplasma synoviae.

Turkeys
For the treatment and prevention of infectious sinusitis and airsacculitis caused by Mycoplasma gallisepticum, Mycoplasma meleagridis and Mycoplasma synoviae.

4.3 Contraindications
Animals should not receive products containing ionophores (monensin, narasin or salinomycin) during or for at least seven days before or after treatment with tiamulin. Severe growth depression or death may result.
Refer to section 4.8 for information regarding interaction between tiamulin and ionophores.

4.4 Special warnings for each target species
In case of reduced feed intake, the inclusion levels in feed may need to be increased to achieve target dosage. Acute cases and severely diseased animals with reduced feed intake should be treated with a product of suitable formulation such as an injectable or water solution.
4.5 Special precautions for use

Special precautions for use in animals

It is sound clinical practice to base treatment on susceptibility testing of the bacteria isolated from the animal. If this is not possible, therapy should be based on local (regional, farm level) epidemiological information about susceptibility of target bacteria.

Refer to section 4.8 for information regarding interaction between tiamulin and ionophores.

Special precautions to be taken by the person administering the veterinary medicinal product to animals

When mixing the veterinary medicinal product and handling the medicated feed, direct contact with eyes, skin and mucous membranes should be avoided. Personal protective equipment should be worn when mixing the veterinary medicinal product or handling the medicated feed: overalls, impervious gloves and either a disposable half-mask respirator conforming to European Standard EN 149 or a non-disposable respirator conforming to European Standard EN 140, with a filter to European Standard EN 143. Wash contaminated skin.

In case of accidental ingestion, seek medical advice immediately and show the package insert or label to the physician. People with known hypersensitivity to tiamulin should administer the product with caution.

4.6 Adverse reactions (frequency and seriousness)

On rare occasions erythema or mild oedema of the skin may occur in pigs following the use of tiamulin.

4.7 Use during pregnancy, lactation or lay

Can be used in pigs during pregnancy and lactation.
Can be used in laying and breeding chickens and turkeys.

4.8 Interaction with other medicinal products and other forms of interaction

Tiamulin has been shown to interact with ionophores such as monensin, salinomycin and narasin and may result in signs indistinguishable from an ionophore toxicosis. Animals should not receive products containing monensin, salinomycin or narasin during or at least 7 days before or after treatment with tiamulin. Severe growth depression, ataxia, paralysis or death may result.

If signs of an interaction do occur, administration of contaminated feed should be stopped immediately. The feed should be removed and replaced with fresh feed not containing the anticoccidials monensin, salinomycin or narasin.
4.9 Amounts to be administered and administration route

Calculations to achieve the correct dose rate and achieve the correct inclusion rate should be based on: Inclusion rate (ppm) = dose rate (mg/kg bwt) x bodyweight (kg) / daily feed intake (kg)

To ensure a correct dosage body weight should be determined as accurately as possible to avoid underdosing.

The intake of medicated feed depends on the clinical condition of the animals. In order to obtain the correct dosage the concentration of tiamulin hydrogen fumarate has to be adjusted accordingly.

**Pigs**

Treatment of Swine Dysentery caused by *B. hyodysenteriae*, treatment of Porcine Colonic Spirochaetosis (colitis) caused by *B. pilosicoli*

Dosage: 5 - 10 mg tiamulin hydrogen fumarate/kg bodyweight daily administered for 7 to 10 consecutive days. The dosage will normally be achieved by an inclusion level of 100 - 200 ppm tiamulin hydrogen fumarate in the finished feed providing that feed intake is unaffected.

<td>0.125 – 0.25 kg</td>
</tr>
</tbody>
</table>

Prevention of Swine Dysentery caused by *B. hyodysenteriae*

Dosage: 2.0 mg tiamulin hydrogen fumarate/kg bodyweight daily. The dosage will normally be achieved by an inclusion level of 40 ppm tiamulin hydrogen fumarate in the finished feed, providing feed intake is unaffected. Preventive medication with tiamulin should be given for 2-4 weeks.

Preventive treatment with tiamulin should only be initiated after confirmed infection with *B. hyodysenteriae* and then as part of a program including measures aiming to eradicate or control the infection in the herd.

Treatment of Porcine Proliferative Enteropathy (ileitis) caused by *L. intracellularis*

Dosage: 7.5 mg tiamulin hydrogen fumarate/kg bodyweight daily administered for 10-14 consecutive days. The dosage will normally be achieved by an inclusion level of 150 ppm tiamulin hydrogen fumarate in the finished feed providing that feed intake is unaffected.

Treatment of Enzootic Pneumonia caused by *M. hyopneumoniae*

Dosage: 5.0 – 10.0 mg tiamulin hydrogen fumarate/kg bodyweight daily administered for 7 to 10 consecutive days. The dosage will normally be achieved by an inclusion level of 100 -200 ppm tiamulin hydrogen fumarate in the finished feed providing that feed intake is unaffected.

Secondary infection by organisms such as *Pasteurella multocida* and *Actinobacillus pleuropneumoniae* may complicate enzootic pneumonia and require specific medication.

Chicken (broiler, replacement pullet, laying and breeding hens)
Treatment and prevention of chronic respiratory disease (CRD) caused by *M. gallisepticum* and airsacculitis and infectious synovitis caused by *M. synoviae*.
Dosage – Treatment and prevention: 25 mg tiamulin hydrogen fumarate/kg body weight daily administered for the period of 3 to 5 consecutive days. This is normally achieved by an inclusion level of 250 - 500 ppm tiamulin hydrogen fumarate in the finished feed provided that feed intake is unaffected. Inclusion levels in the higher range will in most cases be needed to avoid underdosing. In fast growing birds, e.g. broiler chickens during the first 2-4 weeks of life, inclusion levels in the lower range may be sufficient.

Turkey (young poults, breeding turkeys)
Treatment and prevention of infectious sinusitis and airsacculitis caused by *M. gallisepticum, M. synoviae* and *M. meleagridis*.
Dosage – Treatment and prevention: 40 mg tiamulin hydrogen fumarate/kg body weight daily administered for the period of 3 to 5 consecutive days. This is normally achieved by an inclusion level of 250 - 500 ppm tiamulin hydrogen fumarate in finished feed provided that feed intake is unaffected. Inclusion levels in the higher range will in most cases be needed to avoid underdosing. In fast growing birds, e.g. poults during the first 2-4 weeks of life, inclusion levels in the lower range may be sufficient.

Preventive treatment with tiamulin should only be initiated after confirmed infection with *M. gallisepticum, M. synoviae* or *M. meleagridis* and then as an aid in the prevention strategy to reduce the clinical signs and mortality from respiratory disease in flocks, where infection in ovum is likely because the disease is known to exist in the parent generation. The prevention strategy should include efforts to eliminate the infection from the parent generation.

4.10 Overdose (symptoms, emergency procedures, antidotes), if necessary

Pigs: Single oral doses of 100 mg/kg body weight in pigs caused hyperpnoea and abdominal discomfort. At 150 mg/kg no CNS effects were noted except for sedation. At 55 mg/kg given for 14 days a transient salivation and slight gastric irritation occurred. A minimum lethal dose has not been established in the pig.

Poultry: The LD₅₀ for chickens is 1290 mg/kg and turkeys 840 mg/kg bodyweight.
The clinical signs of acute toxicity in chickens are - vocalization, clonic cramps and lateral recumbency. In turkeys signs of acute toxicity include clonic cramps, lateral or dorsal recumbency, salivation and ptosis. If signs of intoxication do occur promptly remove the medicated feed, replace with fresh unmedicated feed and apply supportive, symptomatic therapy.
4.11 Withdrawal Period(s)

Pigs
Prevention (at 2.0 mg/kg bodyweight): Meat and offal: 1 day.
Treatment (at 5-10 mg/kg bodyweight): Meat and offal: 6 days.

Chickens
Meat and offal: 1 day.
Eggs: 0 days.

Turkeys
Meat and offal: 4 days.

5 PHARMACOLOGICAL or IMMUNOLOGICAL PROPERTIES

Pharmacotherapeutic group: antibacterial for systemic use
ATCvet code: QJ01XQ01

5.1 Pharmacodynamic properties

Tiamulin is a bacteriostatic semi-synthetic antibiotic belonging to the pleuromutilin group of antibiotics and acts at the ribosomal level to inhibit bacterial protein synthesis.
Tiamulin has shown in-vitro activity against a wide range of bacteria including *Brachyspira hyodysenteriae*, *Brachyspira pilosicoli*, *Lawsonia intracellularis* and *Mycoplasma* spp.
Tiamulin is bacteriostatic at therapeutic concentrations and has been shown to act at the 70S ribosome level and the primary binding site is on the 50S subunit and possibly a secondary site where the 50S and 30S subunits join. It appears to inhibit microbial protein production by producing biochemical inactive initiation complexes, which prevent elongation of the polypeptide chain.
Mechanisms responsible for resistance development in *Brachyspira* spp to the pleuromutilin class of antibiotics are considered to be based on mutations at the ribosomal target site. Clinically relevant resistance to tiamulin requires combinations of mutations around the tiamulin binding site. Resistance to tiamulin may be associated with decreased susceptibility to other pleuromutilins.

5.2 Pharmacokinetic properties

Pigs
Tiamulin is well absorbed in the pig (over 90%) following oral administration and widely distributed through the body. Following a single oral dose of 10 mg and 25 mg tiamulin/kg bwt the *C* max was 1.03 µg/ml and 1.82 µg/ml respectively by microbiological assay and the *T* max was 2 hours for both. Tiamulin has been shown to concentrate in the lung, a target tissue and also in liver, where it is metabolised and excreted (70-85%) in the bile, the remainder is excreted via the kidney (15-30%). Tiamulin, which has not been absorbed or metabolised, passes down the intestines to the colon and concentrates there.

Chickens
Tiamulin is well absorbed in chickens (70-95%) after oral administration.
Tiamulin distributes widely through the body and has been shown to concentrate in the liver and kidney (sites of excretion) and in the lung (30 times serum level). Excretion is mainly via the bile (55-65%) and kidney (15-30%) as mainly microbiologically inactive metabolites and is quite rapid, 99% of the dose within 48 hours.

Turkeys
In turkeys serum levels of tiamulin are similar to chickens. In breeders on 0.025% tiamulin the average serum level was 0.36 µg/ml (range 0.22-0.5µg/ml).
6 PHARMACEUTICAL PARTICULARS

6.1 List of excipients
Sorbic Acid
Gelatin

6.2 Incompatibilities
None known.

6.3 Shelf-life
The shelf life expiry date for this product shall not exceed 3 years from the date of manufacture. The constituted feeding stuff should not be used later than 3 months after constitution.

6.4 Special precautions for storage
Do not store above 25°C.

6.5 Nature and composition of immediate packaging
25 kg polyethylene lined sack.

6.6 Special precautions for the disposal of unused veterinary medicinal products or waste materials
Any unused product or waste material should be disposed of in accordance with national requirements.
